

The Responsibilities Of Our Planet

The main concern is to try and save our planet from the bad habits that people have. Without forests, plants and water and oxygen we cannot survive.

One of my concerns is the amount of trees our world has cut down is an unreasonable amount. The more trees we cut down the more negative effects this has on our planet. One effect is the loss of oxygen. Which is why we need trees because they help with the creating of oxygen.

Another addition is that there has been incidents in our waterways. A reason that can cause this is pollution. Another impact of pollution is the ocean animals. If a turtle came in contact with a plastic bag it would think it was food and swallow it. This can effect the turtles health and put it in great danger. It could get mildly injured or die.

There have been many impacts on endangered species, which can cause extinction. A few examples are turtles, tigers and lemurs. If we don't help with this we could lose some very valued animals, that are a part of a bigger food chain.

To conclude our planet is a very big responsibility in our lives. It is our choices that depend on how our world can change. I do believe we can make a difference together.
