

Why We Should Take Care Of Our Forests and Seas

It is vital that humans take more care of our environment by not cutting down trees, being careful of what we put down the sink and stop overfishing. This is essential for the survival of the planet.

Forests are home to all kinds of creatures and they rely on it to survive. Deforestation is destroying that reliance on fruits and trees. By destroying fruits, that is limiting food supply. Cutting down trees is destroying homes of animals that live there, then they don't have any where to live, threatening their survival.

Furthermore, I believe that everyone should make an effort to stop putting random stuff down the sink, because all of that goes into the ocean. A fish could swallow rubbish and die, decreasing the population of fish and sea-creatures. The follow on effect is that humans have less food to eat.

Pollution in the sea may kill sea creatures, which can throw the food chain out of balance. For example, bigger fish eat little fish and little fish eat coral, so if there were no big fish all the little fish would eat the coral and eventually kill the coral.

It is vital that humans take more care of our environment and stop cutting down trees and shrubs, be careful of what we put down the sink and stop overfishing now.
